The Maggot tool allows users to describe the Metadata of their datasets produced within a collective (research unit, platform, multi-partner project, etc.), thus making it possible

- to answer certain questions of the Data Management Plan (DMP) concerning the organization, documentation, storage and sharing of data in the data storage space,
- to meet certain data and metadata requirements, referred to by the Open Research Europe (ORE) in accordance with the FAIR principles.

Designed to foster good data management, with « data sharing » in mind.

The use of dictionaries has no other purpose to facilitate the entry of metadata, entry which can be long and repetitive in generalist data warehouses (such as repository based on Dataverse).

Dictionaries allow you to record multiple information necessary to define an entity, such as the names of people or even the funders.

The information, once entered and saved in a file called a dictionary, can be subsequently associated with the corresponding entity.
